SHIELDNIX / SOFTWARE DEVELOPMENT INTERNSHIP

MailSignal.

Evidence-based email verification.
Clear results. Honest uncertainty. No messages sent.

NODE.JS / DNS OVER HTTPS / RENDER OR VERCEL

TEMPLATE - DEPLOYMENT PENDING
Add the live Render or Vercel URL after deploying. Do not submit this template.

LIVE APPLICATION

Editable field - or regenerate the PDF with --live after publishing.

GITHUB REPOSITORY

https://github.com/RenzyyyCursors/Emailer

A small tool with considered engineering.

Paste up to 50 addresses, inspect the evidence for every result, search or filter the list, and export a spreadsheet-safe CSV. Includes a clearly labelled simulated demo.

LIKELY DELIVERED
Recipient accepted locally

LIKELY BOUNCE
Specific negative evidence

UNKNOWN
Not enough evidence

HOSTING LIMITATION

The hosted version checks syntax and DNS mail routing. Render Free and Vercel block SMTP port 25, so healthy routing stays **unknown**; DNS cannot prove a mailbox exists. Optional local SMTP checks are restricted to owned addresses and stop before DATA. Acceptance never guarantees delivery.

The README includes local setup, Render/Vercel deployment steps, tests, privacy details, and verification limits.
